

### Polycyclic Aromatic Hydrocarbons (PAHs)

We, the Oskar Lehmann GmbH & Co. KG, confirm that if the raw materials or precursors we use in the manufacture of our products contain one of the carcinogenic PAHs, none of these exceed the permissible limit of 1 mg/ kg.

In order to obtain the GS mark, an examination of the finished part in the context of its application is decisive. This is also decisive for establishing the permissible thresholds for PAHs. As a supplier of plastic products, we assume that our products are not dangerous goods in accordance with the Product Safety Commission (AfPS) GS 2019:01. Nevertheless, should an examination of one of the products we deliver to you be required, we are ready to have such an examination carried out for a fee. However, this requires a written risk assessment / risk analysis and a categorization with application-dependent limit values for the product by an approved laboratory in accordance with the Product Safety Commission (AfPS) GS 2019:01. This categorization and assessment must be initiated by the manufacturer of the final product.
